# System Analysis & Design

Any financial transactions in most companies are difficult to be paper-based, especially large companies, with the internal and external financial transactions they contain. For this reason, one of them is that the human factor results in an error rate. It is difficult to calculate the percentage of 100. Secondly, if it depends on the human factor, it will be more expensive because I will need the number of workers More and more efficient, and thirdly, I will not be able to specify the company. You will gain or lose through transactions.

## The solution :

Most companies, in order to avoid this problem, rely on software that manages all financial transactions, whether inside or outside the company, and provides graphs showing the state of the company, showing whether it is a gain, no loss, or equal percentages, and it knows payments belonging to any of its clients.

## Idea :

ERP System.
